Militant In the Building Industry.

It is clear that the lockout threat of the New York building industry is going to be met by an organized and sustained struggle by the workers affected. The building trade is an industry, which, in recent years, has been the scene of a number of struggles and disputes.

The building trade has been characterized by a long tradition of militant action, and the workers are well organized. The lockout is expected to be a test of the workers' determination and ability to stand up to the employers.

The workers have been preparing for this showdown for some time. They have been building up their ranks and their organization, and they are determined to fight to the bitter end.

The employers, on the other hand, are not likely to give in easily. They have a strong organization of their own, and they are well represented in the courts and government.

The outcome of the lockout will be watched closely by the workers and the public. It will be a test of the workers' ability to stand up to a powerful enemy and to win the right to work on their own terms.

Trade Union Unity Convention

The Trade Union Unity Convention was held in New York City on May 15, 1977. The convention was attended by delegates from various unions and organizations, and it was a turning point in the history of labor in the United States.

The convention was called by the American Federation of Labor and Congress of Industrial Organizations (AFL-CIO) to discuss the issues facing the labor movement and to find ways to strengthen the unity of workers.

The convention was addressed by many prominent speakers, including John L. Lewis, the president of the United Mine Workers, and Walter Reuther, the president of the United Auto Workers. The speakers called for a renewed commitment to the principles of solidarity and unity, and they urged the delegates to work together to achieve their goals.

Anti-Fascists Expose the Brutal Terror in Bulgaria

The latest issue of the journal, Anti-Fascist, contains an article exposing the brutal methods used by the Bulgarian police to suppress the workers' movement. The article describes the use of torture and violence by the police in their efforts to break the workers' organization.

The article also calls for the international community to take action against the Bulgarian government and to support the workers' struggle for freedom.

Cement

Cement is a binding agent that is used in the construction of buildings and other structures. It is made by heating a mixture of limestone and clay to a high temperature, which causes them to fuse together.

The resulting mixture is then ground into a fine powder, which is called cement. The cement is then mixed with water to form a paste, which is then used to construct buildings, roads, and other structures.

Cement is an important material in the construction industry, and its use has increased significantly over the past few decades. It is estimated that the global demand for cement will continue to rise in the years to come.
